

How the system works?

PATIENTS

- Patients can upload their previous prescriptions, medical records, test reports etc into the system software.
- They can book appointments for offline or online consultation with the doctors registered into the system and make payments online.
- They will receive meeting link in their sms/email for online consultations which they need to join to connect with the doctor.
- They will get their prescriptions through the system after any consultation.

DOCTORS

- Doctors can set consultation date and time through the system.
- Doctors can view medical records of all the patients who have booked an appointment with him.
- Doctors can create video conference through the system and send meeting links to patients who have booked the appointment with the click of a button.
- Doctors can create prescriptions for patients post consultation with integrated WHO's ICD-11.
- Doctors can access patients's medical records/prescriptions from anywhere around the world at any time.

CLINICS

- Clinics can add different doctors in the system who are available for online/offline consultations in their clinic.
- Clinics will be able to set consultation dates/time for the added doctors and also set their fees.
- Clinics will be able to send follow up emails and sms to the patients from the software.
- Clinics will be able to track doctor payouts, etc.

This is just a brief description of the system, there can be more functionalities present in the real system

One click to wellness

An platform for patients, doctors and clinics for offline and online consultations, prescription generation, electronic health record repository and many more.

Who can use this system?

THIS SYSTEM CONSISTS OF THREE MAIN USERS

DOCTORS

PATIENTS

CLINICS

Why should we use it?

DATA SECURITY & COMPLIANCE

Patients can use this system as an online medical record repository which the patients and his doctors can access from anywhere in the world at anytime.

We understand the security and compliance requirement for Protected Health Information (PHI data) and therefore we have built this system in such a way that it is HIPAA compliant.

RURAL HEALTHCARE

Rural healthcare needs serious attention and in order to control the spread of diseases and growing rates of mortality due to inadequate healthcare facilities we must find a solution. This was our primary driving force behind creating this software. With this software system the people from the rural parts of the country will also have access to the best doctors so that they also receive proper treatment at the right time.

WORLD HEALTH ORGANISATION'S (WHO) INTERNATIONAL CLASSIFICATION OF DISEASES (ICD)

We have integrated the WHO's ICD-11 API in our system. These capabilities can be utilised by the doctors while diagnosing patients through the system.

OTHER INITIATIVES

We have also taken care of the concern of lost prescriptions and unwanted fear among patients. Once a patient uploads his previous medical records, they stay on the system, This feature would help the doctor save time, run through the patient's medical history manually and give him the required treatment.

OUR GOAL

We humans are known for finding different ways to make the life smoother as we go on. So we bring to you this service in the healthcare domain so that people get cured sooner i.e. they actually get closer to wellness at one click(just as our caption says). We would love to have you onboarded to our system so that you can use our system efficiently as a patient, or a doctor or as a clinic. We also hope this service becomes a household name and also a tool that helps everyone for their medical needs.
